*Reasons for Allowance*

1. Claims 1-11 are allowed.
2. The following is an examiner's statement of reasons for allowance:

While Saylor (6,084,372) discloses a motion controller for controlling the motion of a plurality of axes. The motion controller including circuitry for generating a first position value in response to a first axis position value, circuitry for generating a second axis position value in response to the first position value, and circuitry for generating a second position value which offsets a change in the first position value due to a change in a mode of operation of the circuitry for generating a first position value.

And Kono (5,267,142) teaches a phase-synchronized spindle rotation control method for performing speed control for first and second spindles of a machine such that the first and second spindles are rotated at the same rotational speed and at the same rotational phase.

Neither of these references taken either alone or in combination discloses a method and device for controlling a follower element in synchronism with a leading element having all the claimed features of applicant's instant invention, specifically including: setting or storing a starting position for starting the synchronism of the follower element and the leading element for accelerating the follower element from the motion start position preceding the start position to the start position of the synchronism. Furthermore, a velocity of the follower element varies linearly from a velocity at the follower motion start position and a velocity at the start position for starting the synchronization. Also, there is no motivation to combine the Saylor reference with the Kono reference to meet these limitations. It is for these reasons that applicant's invention defines over the prior art of record.
